

HUNZA WATER: LIFE'S ELIXIR

Modern scientific research into longevity can be traced to the work of Dr. Henri Coanda (1886-1972). After researching longevity throughout his life he noted that there were five places on Earth where people seemed to live more lengthy and vibrant lives, with many living over one hundred years. One of

these special places was in the remote mountains of the former Kingdom of Hunza, located in the Himalayas. Dr. Coanda researched diet and other factors in order to account for the longevity of these inhabitants and was amazed to discover that vitality and health seemed to be associated with the milky drinking water which flowed from the alpine glaciers of the region. Further research revealed that the water in the other areas carried the same traits.

Unique Colloids Provide Life Energy

Today science recognizes that Hunza water gains its special properties from the unique colloids (microscopic trace minerals) that remain suspended in the water, accounting for its milky appearance. This colloid-filled fluid also holds high concentrations of negative ions that are believed to significantly contribute to good health and vitality. Negative ions provide vital energy to the

body for use in neutralizing toxic "free

radicals". Free radicals arise out of natural metabolic processes and are also added to our bodies through a number of man-made environmental factors. Hunza water works as a powerful, naturally-created liquid crystal antioxidant in much the same way as intracellular water. Anti-aging researchers agree that free radicals play a significant role in the human degeneration that accompanies the aging process. One of the most significant weapons used against free radical are antioxidants.

The Hunza region, and other areas of the world which are naturally blessed with these sources of charged antioxidant colloids, are slowly changing for the worst as industrial pollutants degrade the quality of the global water supply, even in these far away places.

Seeking the Source

The population of the industrialized world is increasingly showing both exhaustion and restlessness, symptoms of a life missing a fundamental balance of energy. Hunza water, if it were readily available, could make a significant contribution toward improving human health around the world. Unfortunately, the limits of geography, economics and politics restrict the availability of this life energy to only those close to the source of this energetic water. It has been the objective of Earthpulse since its founding to provide the best in technology and information for the improvement of the human condition. We are pleased to be working in cooperation with leading European researchers in this area and have synthesized a material which delivers these colloidal antioxidant compounds to the body in a superior manner. Now the world can enjoy what only a few have been able to access in the past, an inexpensive source for these life-enhancing colloidal elements.

First Elements™ = Energy

Through a novel process, researchers have successfully recreated the essence of Hunza water through **First Elements™**, a superior colloidal compound. The process was the result of many years of research leading up to the creation of **First Elements™**. This potassium citrate and nano-silica-based material has been charged with negative ions and trace minerals. The created Hunza-like colloids are spherical in shape and are so fine they can only be created through specialized processing. In fact, these created particles are so small that a teaspoon full contains a surface area equal to that of a football field. These specialized colloids join together to form cage-like structures that transport the negatively-charged antioxidants throughout the body. These cages serve to transport vital energy more directly to the cells, where it can be utilized.

created through specialized processing. In fact, these created particles are so small that a gram contains a surface area equal to that of a football field. These specialized colloids join together to form cage-like structures that transport the negatively-charged antioxidants throughout the body. These cages serve to transport vital energy more directly to the cells, where it can be utilized.

By transporting the colloids in this way the body receives the benefit of powerful antioxidizing effects, but more importantly, the entire system of the body is energized through a more directed form of energy transport. The result is a significantly enhanced energetic state of the body without the sluggish effect of most detoxifying substances. **First Elements™** releases its power only when mixed with fluids and is recommended to be used with non-carbonated water. Today, everyone can have

their own supply of Hunza-like water simply and inexpensively with energized **First Elements™ Nanotronic Nutrients™**. Increasing vital energy without the agitation and toxic effect of stimulants, **First Elements™** provides results you can feel

and detoxifying capabilities that can be easily measured. Using one or two capsules a day will add energy and vitality to life while providing an internal environment conducive to longevity. **First Elements™** is the colloidal wave of the future, and the future is now!
